

Brainstorming

Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits

Objective

To explore food ordering data using Tableau and uncover the factors that influence order demand, customer spending, cuisine preference, and delivery performance, so the business can make faster, data-driven decisions.

Brainstorming Ideas

- Analyze total order volume and total order value across the dataset.
- Identify the most ordered cuisines and meal types (breakfast, lunch, dinner, snacks).
- Study city-wise demand to find top-performing locations.
- Analyze delivery fee patterns alongside order value.
- Track time taken for delivery and its distribution across cities.
- Identify peak mealtimes and how demand shifts across the day.
- Compare average order value across different cuisines and cities.
- Spot outliers in delivery time that indicate service delays.
- Build KPI cards for total orders, average delivery time, and top cuisine.
- Design interactive filters (city, cuisine, meal type) for drill-down analysis.
- Package the dashboard and story inside a Flask web app for easy sharing.

Expected Outcome

A structured, interactive Tableau dashboard and story that turns raw order-level data into insights on customer behaviour and delivery performance, helping the business identify strong-performing cities/cuisines and operational bottlenecks.
