

Problem Statement

Food Ordering Behaviour and Consumer Trends

The food delivery industry is becoming increasingly competitive, with businesses facing challenges in understanding customer behaviour, optimizing delivery performance, and maximizing revenue.

Despite having large volumes of order data, it is often difficult to identify the key factors that influence order demand, customer spending patterns, and service efficiency. This creates a need for a structured analytical approach that can convert raw data into actionable insights.

The project aims to develop an interactive Tableau dashboard and story that allow users to:

- Monitor total orders and total order value.
- Track average delivery time and identify slow-performing regions.
- Compare cuisine and meal-type preferences.
- Analyze city-wise order demand.
- Understand the relationship between delivery fee and order value.
- Identify peak mealtimes and business improvement opportunities.

The solution helps Business Analysts, Operations Managers, and platform stakeholders improve operational efficiency, delivery speed, and customer satisfaction through visual analytics.
