

Customer Journey Map

Food Ordering Behaviour and Consumer Trends

Stage 1: Discover

The customer opens the food ordering app and browses available cuisines, restaurants, and meal categories. Ratings, pricing, and delivery time estimates shape the first impression.

Stage 2: Browse

The customer compares cuisines, checks order value against delivery fee, and looks at typical delivery times before deciding what to order.

Stage 3: Order Placement

The customer selects a meal type (breakfast, lunch, dinner, or snack), chooses items, and places the order, which is logged with an Order ID, Order Value, Cuisine, and City.

Stage 4: Order Processing

The restaurant prepares the order and hands it to the delivery partner. Time Taken for Delivery starts being tracked from this point.

Stage 5: Delivery

The order reaches the customer within the estimated delivery window. Delivery speed is one of the biggest drivers of customer satisfaction.

Stage 6: Feedback & Reorder

The customer forms an impression based on delivery speed and value for money. A good experience increases the likelihood of reordering and platform loyalty.

Business Insight

Mapping each stage highlights exactly where delays or friction occur, and connects them back to measurable fields in the dataset - City, Cuisine, Meal Type, Delivery Fee, and Time Taken for Delivery - so the Tableau dashboard can be designed around real customer pain points.
