

Problem Solution Fit

Food Ordering Behaviour and Consumer Trends

Problem

Food delivery businesses generate large volumes of order-level data every day. Without proper analysis, it becomes difficult to identify order demand drivers, spending patterns, and service performance issues. This limits the ability to make informed decisions and improve delivery efficiency.

Proposed Solution

Develop an interactive Tableau dashboard and story that transform raw food ordering data - Order ID, Order Value, Delivery Fee, Cuisine, Meal Type, City, and Time Taken for Delivery - into meaningful visual insights, then embed them in a Flask web application for easy access.

Benefits

- Provides a clear overview of order demand and revenue.
- Identifies top-performing cities and high-demand cuisines.
- Highlights peak mealtimes and delivery time distribution.
- Supports data-driven decision-making for both business strategy and operations.
- Enables interactive, self-serve exploration of the data.

Value to Business

The dashboard helps Business Analysts and Operations Managers monitor key performance indicators, improve delivery efficiency, and prioritize the cuisines and cities that matter most - while giving customers, like Neha, the fast and reliable service they expect.
