

Proposed Solution

Food Ordering Behaviour and Consumer Trends

The proposed solution is an interactive Tableau dashboard and story that analyze food ordering behaviour and consumer trends using historical order data.

The dashboard provides visual insight into:

- Total Orders and Total Order Value
- Average Delivery Fee
- Average Time Taken for Delivery
- Cuisine and Meal Type distribution
- City-wise order demand
- Order trends and peak mealtimes
- Delivery time distribution and outliers

Interactive filters (City, Cuisine, Meal Type) let users explore the data by segment.

A Tableau Story presents the findings step by step, and the whole experience is embedded in a Flask web application so it can be shared as a normal website rather than a raw Tableau link.

Expected Outcome

- Understand customer ordering patterns across cities and cuisines.
- Improve delivery speed and customer satisfaction.
- Increase operational efficiency through better resource planning.
- Identify opportunities to grow order value and revenue.
- Support strategic business planning through accessible visual analytics.
