

Solution Architecture

Food Ordering Behaviour and Consumer Trends

Step 1: Data Collection

- Collect the food ordering dataset from the source system / file.
- Capture Order ID, Order Value, Delivery Fee, Cuisine, Meal Type, City, and Time Taken for Delivery for every order.

↓

Step 2: Data Preparation

- Import the dataset into Tableau.
- Clean missing values and remove duplicate records.
- Format fields and create calculated fields required for KPIs.

↓

Step 3: Data Analysis

- Calculate KPIs: Total Orders, Average Order Value, Average Delivery Time, Top Cuisine.
- Analyze city-wise and cuisine-wise ordering behaviour.
- Analyze meal-type distribution and delivery performance.

↓

Step 4: Dashboard Development

Create an interactive Tableau dashboard using:

- KPI Cards
- Bar Charts
- Pie Charts
- Line Charts
- Filters
- Dashboard Containers

↓

Step 5: Story Creation

Develop a Tableau Story that explains:

- Business Overview
- City & Cuisine Demand
- Delivery Performance
- Meal Type Preferences
- Key Business Insights

Step 6: Web Integration

Publish the dashboard and story to Tableau Public, then embed them in a Flask web application (Home, Dashboard, Story, About pages) for a responsive, browsable experience.

Step 7: Output

The final output is a web application that presents an interactive Tableau Dashboard and Story, enabling users to analyze customer behaviour, monitor delivery performance, and make data-driven decisions.
