

Project Development Phase - 2nd PDF

Dashboard and Story

Dashboard Overview

The Food Ordering Behaviour and Consumer Trends Dashboard is an interactive Tableau dashboard designed to provide meaningful insight into order demand, cuisine and meal-type preferences, city-wise trends, and delivery performance.

The dashboard presents key business metrics and visualizations in a simple, interactive format, enabling users to monitor performance and identify trends that support strategic decision-making.

Dashboard Objectives

- Monitor overall business performance.
- Analyze customer ordering behaviour.
- Identify popular cuisines and meal types.
- Evaluate city-wise order demand.
- Measure delivery performance and consistency.
- Support data-driven business and operational decisions.

Dashboard Components

KPI Cards

The dashboard includes KPI cards for:

- Total Orders - total number of food orders placed.
- Total Order Value - total revenue generated from orders.
- Average Delivery Time - average time taken to deliver an order.
- Top Cuisine / Active Restaurants - highest-demand cuisine and platform reach.

Dashboard Visualizations

Cuisine Analysis - Bar Chart

Compares different cuisines based on number of orders and order value, identifying the most popular cuisines and customer preferences.

Business Insight: Restaurants can prioritize high-demand cuisines to increase orders and revenue.

Meal Type Analysis - Pie / Donut Chart

Shows the distribution of orders across meal types (breakfast, lunch, dinner, snacks).

Business Insight: Understanding mealtime demand helps plan staffing and promotions.

City-wise Demand - Map / Bar Chart

Illustrates order volume by city, highlighting top-performing and underperforming regions.

Business Insight: Businesses can prioritize investment and delivery resources in high-demand cities.

Delivery Time Distribution - Histogram / Box Plot

Displays the spread of delivery times and highlights cities or cuisines with delivery delays.

Business Insight: Longer delivery times indicate areas where operational improvement is needed.

Order Value vs Delivery Fee - Scatter Plot

Compares order value against delivery fee to understand pricing patterns.

Business Insight: Helps evaluate whether delivery pricing is proportionate to order size.

Dashboard Filters

Interactive filters allow users to analyze data dynamically, including:

- City
- Cuisine
- Meal Type

Interactivity Features

- Interactive filters
- Highlight actions
- Tooltips
- Dynamic labels
- Responsive layout
- Dashboard containers for organized presentation

Tableau Story

The Tableau Story presents the dashboard insights in a logical sequence, helping users understand the complete analysis.

Scene 1 - Business Overview

Introduces the project and presents overall performance using KPIs.

Scene 2 - Cuisine & Meal Type Preferences

Explains ordering patterns and highlights the most popular cuisines and mealtimes.

Scene 3 - City-wise Demand

Analyzes order volume and revenue across cities to identify top-performing regions.

Scene 4 - Delivery Performance

Illustrates delivery time distribution and identifies cities/cuisines with delays.

Scene 5 - Order Value & Pricing

Compares order value against delivery fee to evaluate pricing strategy.

Scene 6 - Key Business Insights

Summarizes the key findings and provides recommendations for improving delivery speed, operational efficiency, and overall business performance.

Key Findings

- Ordering patterns can be clearly identified using interactive visualizations.
- A small set of cuisines and cities drive a large share of total orders.
- Delivery time varies noticeably across cities, pointing to operational gaps.
- Meal-type analysis reveals clear lunch and dinner peaks.
- Order value and delivery fee are broadly aligned but with some outliers.
- Interactive filters enable detailed, flexible analysis for every persona.

Business Benefits

- Supports informed decision-making.
- Improves delivery performance and customer satisfaction.
- Identifies growth opportunities by cuisine and city.
- Simplifies business reporting.
- Enhances understanding of customer ordering behaviour.

Conclusion

The Food Ordering Behaviour and Consumer Trends dashboard successfully transforms raw order data into interactive, meaningful visual insights. Through KPI cards, charts, filters, and a Tableau Story - all embedded in a Flask web application - the project gives Business Analysts, Operations Managers, and customers a shared, data-driven view of business and delivery performance.
